ANALYSIS PROMPT

SKU variants and affiliate videos

TikTok Shop US · FastMoss MCP data · goods imported from Vietnam

Item	Details
Purpose	Choose the right variants (colour, size, price) and the right cross-sell products for a niche, based entirely on FastMoss data.
Use when	You have chosen 4 core products (SP1 to SP4) for a niche and need to decide which variants to import and what to sell alongside.
You need	FastMoss MCP connected to Claude or ChatGPT with credit remaining; the FastMoss links of the 4 products.
Output	3 tables you can paste straight into Google Sheets: best-selling attributes, highest-converting variants from videos, 5 cross-sell products.
Version	2.0 · 03 Nov 2026

1. What this prompt does

The prompt runs three steps in sequence. Each step produces one table.

Step	Task	FastMoss tools	Output
1	Best-selling attributes by colour, size, price and material	product_search, product_sales_trend, product_sku	Block 1 (7 columns)
2	Highest-converting variants from videos	product_video_list	Block 2 (11 columns)
3	5 cross-sell products of a different type	product_search (by keyword)	Block 3 (11 columns)

> **Principle.** Use only the numbers FastMoss returns; never estimate. Blocks 1 and 2 use only the 4 input products; only Block 3 may search for new products.

2. How to use it

1. **Fill in the 4 inputs** in the INPUT part of the prompt (table below).
2. **Open a new conversation** and turn on FastMoss MCP. Use this same conversation for all three steps.
3. **Paste the prompt** (section 3) and run it.
4. **Check the result** against the checklist (section 4).

5. **Paste each block** into the right sheet. There is no column header row, so the sheet must already have its headers.

Inputs to fill in

What to replace	Content
`[NICHE]`	One sentence describing the niche: customer, characteristics, product group.
`[LINK SP1]` to `[LINK SP4]`	The FastMoss links of the 4 products. The final string of digits in each link is the product_id.
Market	US (USD) by default. To change market, change the "Market" line and the region filter.

> **Note.** Step 3 suggests sample keywords for sleep and wellness accessories (silk, bamboo). For a different niche, change the example keywords in STEP 3, item a, to fit your niche.

3. The prompt

Copy everything inside the box below. Replace the parts in [square brackets].

```
ROLE
You are an expert in SKU variant analysis and affiliate video analysis on TikTok Shop US,
working for a seller who imports goods from Vietnam.

PRINCIPLES
1. Every number comes from FastMoss MCP. Do not estimate. Do not invent colours, sizes or
materials.
2. Calculations use only the numbers FastMoss returns. If a number is missing, leave the cell
empty.
3. Block 1 and Block 2 use SP1 to SP4 only. Only Block 3 may search for new products.

INPUT
- Market: US (prices in USD)
- Niche: [NICHE]
- Product list (the product_id is the final string of digits in each link):
  SP1: [LINK SP1]
  SP2: [LINK SP2]
  SP3: [LINK SP3]
  SP4: [LINK SP4]

CONVENTIONS
- Product type: 1-3 English words taken from the product name (for example: pajama set,
pillowcase).
- Material: in English, taken from the product name (for example: mulberry silk, bamboo
viscose). If the title does not state a material, leave it empty.
- A SKU name is split into:
  + Size: the part containing XS/S/M/L/XL/XXL, Twin/Full/Queen/King/California
  King/Standard/Travel, or a number followed by inch/in/cm.
  + Colour: the part that is a colour name.
```

+ Anything else (momme, style, quantity...): ignore.
+ If a SKU name has only one attribute, fill that column and leave the other empty. If neither attribute can be extracted, exclude that SKU from the Colour/Size rankings (it still counts toward Price).

- Sales share: if the SKU sales shares of a product add up to about 1, multiply by 100 to convert to %; if they add up to about 100, keep as is; otherwise leave that product's estimated units empty and add a note.
- Price ceiling: the highest SKU price across SP1–SP4. If there is no SKU price, use the highest price from product_search across SP1–SP4.

STEP 1. Best-selling attributes (SP1–SP4)

For each SP:

a. Call product_search (filter: region US, product_id; do not filter listing_status) to get the name, shop name, lowest price, highest price and 28-day units sold. If there is no result, call product_sales_trend (time_range_days 28) and use period_units_sold.

b. From the product name, record Product type and Material per CONVENTIONS.

c. Call product_sku (time_range_days 28) to get each SKU's name, price and sales share. Price = the SKU price returned by FastMoss; if product_sku has no price, leave that product's Price column empty and add a note.

d. Estimated SKU units = sales share (%) × the product's 28-day units sold / 100.

e. AGGREGATE sales share and estimated units for each value of Colour, of Size and of Price (within each SP). For each attribute, rank by estimated units descending (ties: by value A→Z, or by price ascending) and keep at most the top 5 values.

f. Material across products: group SP1–SP4 by Material, add up the 28-day units sold, rank descending, keep at most 5 values.

STEP 2. Video conversion (SP1–SP4)

For each SP:

a. Call product_video_list (time_range_days 28, no is_ad filter, orderby units_sold desc, pagesize 10, page 1). Call page 2 ONLY if page 1 returns a full 10 videos. Record: video author, views, units sold, GMV, video_desc, fastmoss_url and the ad flag (is_ad) if present.

b. Remove videos posted by the shop itself: the video author equals or nearly equals the product's shop name (from Step 1), or the data states it is the shop's own account. If there is no author information, keep the video.

c. Count the ad videos among the remaining videos of each SP (for the note; do not remove them).

d. Assign a variant to a video ONLY by matching video_desc against that same SP's Colour and Size lists from Step 1:
+ Match case-insensitively and by whole word (no partial matches inside other words).
+ Variant = the pair (Colour, Size). If only one attribute matches, leave the other empty.
+ If a video matches 2 or more values of the same attribute, or matches nothing, assign "Unknown".
+ Do NOT call video_detail_analysis.

e. Variant SKU price = the price of the SKU with the highest estimated units among the SKUs matching that variant (from Step 1). Leave the "Unknown" group empty.

f. Group videos by variant (including the "Unknown" group) and calculate:
Conversion rate = total units sold / total views × 1000.
GPM = total GMV / total views × 1000.

g. Rank only variants with total views of at least 10000. Rank by conversion rate descending (ties: GPM) and keep at most 5. Always write the "Unknown" group on the last row of each SP as a benchmark (even if it has fewer than 10000 views).

STEP 3. Cross-sell products of a different type (new products allowed)

a. Choose short English keywords for sleep or wellness accessory types that the same customers often buy in addition, and that are DIFFERENT from every Product type of SP1–SP4 recorded in

Step 1. Prefer silk or bamboo (for example: silk scrunchies, silk sleep mask, silk bonnet, bamboo sheets, bamboo sleep socks; drop any keyword that matches a type in SP1–SP4).
b. Start with 3 keywords. For each keyword, call product_search (keywords, filter: region US, listing_status on_sale; orderby day28_units_sold desc; pagesize 10; page 1). Add a 4th or 5th keyword only if fewer than 5 qualifying products remain after filtering.
c. Merge the results and remove: duplicates; SP1–SP4; combos, bundles and multi-type sets; products of the same type as SP1–SP4; products that do not fit the niche's customer. Products whose title says polyester or satin (not silk or bamboo) may stay but are chosen only when there are not enough silk or bamboo products.
d. Actual price = 28-day GMV / 28-day units sold (if units sold is 0, use the lowest price).
e. Cross-sell eligibility: actual price ≤ Price ceiling and 28-day units sold > 0.
f. Momentum = 7-day units sold × 4 / 28-day units sold (leave empty if 28-day units sold is 0).
g. Choose 5 products, at most 2 per product type. Prefer Momentum ≥ 1.1 and, within that group, rank by 28-day units sold descending; if there are not enough, take the best-selling remaining products. Label them SP5 → SP9 in the order chosen.
h. Cross-sell with: choose the one code in SP1–SP4 whose Product type is most related in usage; on a tie, choose the SP with the higher 28-day units sold.
i. Linked creators and Affiliate commission come from product_search (commission as a percentage number, for example 15).
j. Verdict: Do = Momentum ≥ 1.1 and linked creators ≥ 20; Drop = Momentum < 0.8; otherwise Consider.

OUTPUT FORMAT (3 blocks only)

- Put each block in its own code block for copying. Columns are separated by a Tab character. No column header row.
- Numeric columns contain numbers only: decimal point, no currency symbol or %, no thousands separator.
- Rounding: estimated units, views, units sold and creator counts: 0 decimals. Sales share, conversion rate, GPM, prices, Momentum and commission: 2 decimals.
- Leave cells with missing data empty.
- Below each block (outside the code block) add at most 1 "Note" line about missing data or limitations.

BLOCK 1. Best-selling attributes

Order SP1 → SP4. Within each SP, in the order Colour → Size → Price, each attribute ranked 1 → 5. At the end add the Material rows across products (Product code "All", Total sales share left empty). Exactly 7 columns:
Product code | Material | Attribute (Colour, Size, Price or Material) | Value | Rank | Total sales share | Estimated units sold, 28 days

BLOCK 2. Highest-converting variants from videos

Order SP1 → SP4, rank 1 → 5, with the "Unknown" group last in each SP (leave Rank empty). Exactly 11 columns:
Product code | Rank | Colour | Size | Material | SKU price | Number of videos | Total views | Conversion rate (units sold per 1000 views) | GPM | FastMoss link of the group's best-selling video

BLOCK 3. 5 cross-sell products of a different type

Exactly 11 columns:
Product code (SP5 to SP9) | Product name | Product type | Cross-sell with (SP1 to SP4) | Actual price | Units sold, 28 days | Momentum | Linked creators | Affiliate commission | Verdict | FastMoss link

CONSTRAINTS

- Block 2 is an approximation, because FastMoss counts video sales per product rather than per

```
SKU, and video units and GMV are estimates. You must state this in the Block 2 Note, together
with the number of ad videos / total videos for each SP (for example: SP1 3/18).
- Block 3 must not contain a product of the same type as SP1–SP4. If fewer than 5 products
qualify, list the number available and note the reason.
```

4. Checking the result

- There are exactly 3 blocks, each in its own code block.
- Block 1 has 7 columns; Blocks 2 and 3 have 11 columns; columns are separated by Tabs; there is no header row.
- Numeric columns contain numbers only: no currency symbol, no %, no thousands separator.
- Below Block 2 there is a note that the figures are estimates, with the number of ad videos / total videos for each SP.
- Block 3 has no product of the same type as SP1 to SP4 and has all 5 products (or states why some are missing).
- Cells with missing data are left empty; no number has been invented.

5. Filled-in example

The INPUT part below is filled in for a niche of sleepwear in mulberry silk and bamboo. Replace the INPUT part of the prompt in section 3 with this text to run it straight away.

```
INPUT
- Market: US (prices in USD)
- Niche: Americans aged 25–40 who follow a wellness lifestyle and buy sleepwear and sleep
accessories made from mulberry silk and bamboo fibre.
- Product list (the product_id is the final string of digits in each link):
  SP1: https://www.fastmoss.com/e-commerce/detail/1729438233542234865
  SP2: https://www.fastmoss.com/e-commerce/detail/1729456314749522750
  SP3: https://www.fastmoss.com/e-commerce/detail/1732496800826823430
  SP4: https://www.fastmoss.com/e-commerce/detail/1732396768684839742
```

6. What changed from the original

The content and formulas are unchanged. This version only reorganises the text and clarifies ambiguous points.

Change	Details
Reorganised	Separate ROLE, PRINCIPLES, INPUT, CONVENTIONS, three STEPS, OUTPUT FORMAT, three BLOCKS and CONSTRAINTS. Lettered items (a, b, c) in each step for quick reference.
Parameterised	The niche and the 4 links are replaced by placeholders so the prompt can be reused for another niche. The filled-in version is in section 5.
Conventions gathered	How Colour and Size are split, the sales share rule and the Price ceiling are gathered in one CONVENTIONS part instead of being scattered.

Three points clarified, please confirm

Ambiguity in the original	How this version reads it
“No title” in the output format	Read as **no column header row** (headers already exist in the sheet), so the output can be pasted directly. If it meant no block titles, change this line back.
Total sales share is neither about 1 nor about 100	The original is silent. This version leaves that product’s estimated units empty and adds a note.
The "Material across products" rows in Block 1	The original does not say what the Material column holds on these rows. This version keeps the stated convention: Product code "All", Total sales share empty, and the material value in the Value column.
